WHO Report on Microplastics in Drinking Water

[This report](#) is WHO's first effort to investigate the potential human health risks associated with exposure to microplastics in the environment, examining the potential health impacts of exposure to microplastics through drinking-water.

Recommendations are made with respect to monitoring and management of microplastics and plastics in the environment, and to better assess human health risks and inform appropriate management actions, a number of key knowledge gaps are identified.

Congratulations to the incoming committee members for 2019-2022!
